

Development of a real-time information and monitoring system to support the risk assessment of nanomaterial under REACH

www.lifenanomonitor.eu

The newly started European Commission LIFE project NanoMONITOR addresses the challenges of supporting the risk assessment of nanomaterials under REACH by development of a real-time information and monitoring system.

Despite the growing number of engineered nanomaterials (ENMs) already available on the market and in contrast to their benefits the use, production, and disposal of ENMs raises concerns about their environmental impact.

Within this context, the overall aim of LIFE NanoMONITOR is to improve the use of environmental monitoring data to support the implementation of REACH regulation and promote the protection of human health and the environment when dealing with ENMs. Within the EU REACH Regulation, a chemical safety assessment report, including risk characterisation ratio (RCR), must be provided for any registered ENMs. In order to address these objectives, the project partners have developed a rigorous methodology encompassing the following aims:

- ✓ Develop a novel software application to support the acquisition, management and processing of data on the concentration of ENMs.
- ✓ Develop an on-line environmental monitoring database (EMD) to support the sharing of information.
- ✓ Design and develop a proven monitoring station prototype for continuous monitoring of particles below 100 nm in air (PM_{0.1}).
- ✓ Design and develop standardized sampling and data analysis procedures to ensure the quality, comparability and reliability of the monitoring data used for risk assessment.
- ✓ Support the calculation of the predicted environmental concentration (PEC) of ENMs in the context of REACH.

Nanosafety Cluster Meeting, Stockholm

RELEVANT NEWS

NanoMONITOR kickoff meeting was held on the 19th January 2016 in Valencia (Spain) on which participants discussed the first steps of the development of the information and monitoring system to support the risk assessment of ENMs.

The 2nd partners' meeting of the project took place on 14-15 June 2016 in Athens, Greece on which the participants discussed the progress so far, next steps and also presented the project to the external monitoring team.

Take a survey on risk management measures

Take a survey on risk management measures and conditions of operations for handling engineered nanomaterials.

This short survey will support us to identify relevant engineered nanomaterials related to criteria such as exposure routes, release factors and the forms in which engineered nanomaterials are placed on the market.
